

Intelligent Mechanical Systems Program

The academic field of this program consists of studies of mechatronics (electrical and electronics, information technology, and mechanics), which are necessary to make up advanced intelligent mechanical systems, and a wide range of curriculum for understanding human beings, including medical and welfare engineering, sports engineering, and thought on cultural language. The ultimate aim of this program is to educate students who can contribute to realize society where all of us can enjoy our living, utilizing smart technologies. They have specialized knowledge of mechatronics and assistive technologies that support human-centered society (Society 5.0).
